

Attachment 1: Illustration of the quantitative mapping approaches

1. Single match:

One National Competence-Based Catalogue of Learning Objectives 2.0 (NKLM) item was considered covered if at least one Modular Curriculum of Medicine (MCM) objective was assigned to this category.

For example, 6 out of 8 NKLM items are assigned at least one MCM objective, yielding a coverage of **75%**.

2. Multiple match:

One NKLM item was considered covered if at least three MCM objectives were assigned to this category.

For instance, 2 out of 8 NKLM items are covered by at least three MCM objectives, indicating a **25%** coverage.

3. Subordinate match:

The coverage of an NKLM objective at level 2 was derived according to the percentage of its subordinate objectives (level 3) that were considered to be covered according to the single match method.

For instance, NKLM Level 2 'a' is covered by 2 of 3 items (67%). 'b' by 1 of 2 items (50%) and 'c' by 3 out of 3 items (100%). Resulting in a coverage of **72%** (mean of 67%, 50% and 100%).
